

NIH NHLBI ARDS Clinical Network Mechanical Ventilation Protocol Summary

INCLUSION CRITERIA: Acute onset of

- 1. $PaO_2/FiO_2 \le 300$ (corrected for altitude)
- 2. Bilateral (patchy, diffuse, or homogeneous) infiltrates consistent with pulmonary edema
- 3. No clinical evidence of left atrial hypertension

PART I: VENTILATOR SETUP AND ADJUSTMENT

- Calculate predicted body weight (PBW)
 Males = 50 + 2.3 [height (inches) 60]
 Females = 45.5 + 2.3 [height (inches) -60]
- 2. Select any ventilator mode
- 3. Set ventilator settings to achieve initial $V_T = 8 \text{ ml/kg PBW}$
- $\label{eq:relation} 4. \quad \mbox{Reduce V_T by 1 ml/kg at intervals} \leq 2 \mbox{ hours until V_T} = 6ml/kg \mbox{PBW}.$
- 5. Set initial rate to approximate baseline minute ventilation (not > 35 bpm).
- 6. Adjust V_T and RR to achieve pH and plateau pressure goals below.

OXYGENATION GOAL: PaO₂ 55-80 mmHg or SpO₂ 88-95%

Use a minimum PEEP of 5 cm H_2O . Consider use of incremental FiO₂/PEEP combinations such as shown below (not required) to achieve goal.

Lower PEEP/higher FiO2

FiO ₂	0.3	0.4	0.4	0.5	0.5	0.6	0.7	0.7
PEEP	5	5	8	8	10	10	10	12

FiO ₂	0.7	0.8	0.9	0.9	0.9	1.0
PEEP	14	14	14	16	18	18-24

Higher PEEP/lower FiO2

			-					
FiO ₂	0.3	0.3	0.3	0.3	0.3	0.4	0.4	0.5
PEEP	5	8	10	12	14	14	16	16

FiO ₂	0.5	0.5-0.8	0.8	0.9	1.0	1.0
PEEP	18	20	22	22	22	24

PLATEAU PRESSURE GOAL: \leq 30 cm H₂O

Check Pplat (0.5 second inspiratory pause), at least q 4h and after each change in PEEP or $V_{\text{T}}.$

If Pplat > 30 cm H_2O : decrease V_T by 1ml/kg steps (minimum = 4 ml/kg).

If Pplat < 25 cm H₂O and V_T< 6 ml/kg, increase V_T by 1 ml/kg until Pplat > 25 cm H₂O or V_T = 6 ml/kg.

If Pplat < 30 and breath stacking or dys-synchrony occurs: may increase V_T in 1ml/kg increments to 7 or 8 ml/kg if Pplat remains \leq 30 cm H₂O.

pH GOAL: 7.30-7.45

Acidosis Management: (pH < 7.30)

If pH 7.15-7.30: Increase RR until pH > 7.30 or $PaCO_2 < 25$ (Maximum set RR = 35).

If pH < 7.15: Increase RR to 35.

If pH remains < 7.15, V_{T} may be increased in 1 ml/kg steps until pH > 7.15 (Pplat target of 30 may be exceeded).

May give NaHCO3

Alkalosis Management: (pH > 7.45) Decrease vent rate if possible.

I: E RATIO GOAL: Recommend that duration of inspiration be \leq duration of expiration.

PART II: WEANING

A. Conduct a SPONTANEOUS BREATHING TRIAL daily when:

- 1. FiO₂ \leq 0.40 and PEEP \leq 8 OR FiO₂ \leq 0.50 and PEEP \leq 5.
- 2. PEEP and $FiO_2 \leq$ values of previous day.
- 3. Patient has acceptable spontaneous breathing efforts. (May decrease vent rate by 50% for 5 minutes to detect effort.)
- 4. Systolic BP \geq 90 mmHg without vasopressor support.
- 5. No neuromuscular blocking agents or blockade.

B. SPONTANEOUS BREATHING TRIAL (SBT):

If all above criteria are met and subject has been in the study for at least 12 hours, initiate a trial of UP TO 120 minutes of spontaneous breathing with FiO2 \leq 0.5 and PEEP \leq 5:

1. Place on T-piece, trach collar, or CPAP \leq 5 cm H₂O with PS \leq 5

- 2. Assess for tolerance as below for up to two hours.
 - a. $SpO_2 \ge 90$: and/or $PaO_2 \ge 60$ mmHg
 - b. Spontaneous $V_T \ge 4 \text{ ml/kg PBW}$
 - c. $RR \le 35/min$
 - d. pH ≥ 7.3
 - e. No respiratory distress (distress= 2 or more)
 - ➤ HR > 120% of baseline
 - Marked accessory muscle use
 - Abdominal paradox
 - > Diaphoresis
 - Marked dyspnea
- 3. If tolerated for at least 30 minutes, consider extubation.
- 4. If not tolerated resume pre-weaning settings.

Definition of <u>UNASSISTED BREATHING</u> (Different from the spontaneous breathing criteria as PS is not allowed)

- 1. Extubated with face mask, nasal prong oxygen, or room air, OR
- 2. T-tube breathing, OR
- 3. Tracheostomy mask breathing, OR
- 4. CPAP less than or equal to 5 cm H₂0 without pressure support or IMV assistance.
